Education

Korea Advanced Institute of Science & Technology (KAIST), Republic of Korea

Ph.D., Electrical Engineering (Feb 2017)

- Thesis title: Networking Stack Abstraction for High-performance Flow-processing Middleboxes
- Advisor: KyoungSoo Park

University of Pittsburgh, Pittsburgh, Pennsylvania, USA

M.S., Computer Science (Apr 2010)

- Advisors: KyoungSoo Park & Daniel Mossé

Lahore University of Management Sciences, Lahore, Pakistan

BSc (Hons), Computer Science (May 2005)

- Minor in Mathematics

Research Interest

Networked systems, distributed systems, network security and operating systems.

Employment Experience

Intel Labs, Telco Systems Research Group **May 2017-onwards**
- Research Scientist

Korea Advanced Institute of Science & Technology (KAIST) **Feb 2017-Apr 2017**
- Postdoctoral Researcher

International Computer Science Institute, Berkeley, CA, US Summer '14 & **Fall '15**
- Research Intern, Bro team: Developed a packet acquisition & filter framework for 10 Gbps network applications.

Palmchip Corporation, Lahore, Pakistan **May 2005-July 2006**
- Software Engineer, Embedded Systems Group: Optimized bootloader & filesystem performances for an in-house system-on-chip network-attached storage device series.

Syed Murad Ali, Toronto, Canada **Summer 2004**
- Intern, Web development (PHP & HTML).

Projects/ Software

1. Omec Project Feb 2019-

The Open Mobile Evolved Core (OMEC) project is an initiative from the Open Networking Foundation (ONF) to create an open source virtualized evolved packet core for 4G/LTE networks. OMEC comprises of a number of VNFs including (i) OpenMME: a Mobility Management Entity function, (ii) C3PO: a suite packaging Home Subscription Service (HSS), Database, Charge Data Function (CDF), Charge Trigger Function (CTF), and Policy Control Rules Function (PCRF), and (iii) ngic-rtc: a control user plane separated (CUPS) 3GPP TS23501 based Service and Packet gateway functions. **OMEC won the Intel Division Recognition Award 2019.**
Role: Co-maintainer of ngic-rtc
Project homepage: http://www.omecproject.org/
Source code: https://github.com/omec-project/ngic-rtc

2. mOS Stack May 2016-

The mOS networking stack provides elegant abstractions for stateful flow processing tailored for middlebox applications. Our API allows developers to focus on the core application logic while it relieves the burden of dealing with low-level packet/flow processing themselves. Under the hood, the stack implements an efficient event system derived from mTCP, a high-performance user-level TCP/IP stack. mOS won the **NSDI Best Paper Award 2017**. We plan to move the project to DPDK.org for broader impact. Discussion is on-going with Intel folks.
Role: Lead author & maintainer
Project homepage: http://mos.kaist.edu/
Source code: https://github.com/ndsl-kaist/mOS-networking-stack
Related publication: Refer to our mOS paper at NSDI 2017

3. Packet Bricks Sept 2014-

A netmap-based packet layer for distributing and filtering traffic
Role: Lead author & maintainer
Source code: https://github.com/bro/packet-bricks

4. mTCP Sept 2013-

mTCP is a high-performance user-level TCP stack for multi-core systems that addresses the inefficiency from the ground up - from packet I/O and TCP connection management to the application interface. mTCP (1) allows efficient flow-level event aggregation, and (2) performs batch processing of RX/TX packets for high I/O efficiency. mTCP improves the performance of small message transactions by a factor 25 and 3 than that of the latest Linux TCP stack and the best-known research prototype. It also improves the performance of various popular applications by 33% to 320% compared with those on the Linux stack. mTCP won the **NSDI Community Award 2014** and was declared runner-up in the **Samsung HumanTech Paper Award 2014**. We plan to move the project to DPDK.org for broader impact. Discussion is on-going with Intel folks.
Role: Co-author & co-lead maintainer
Project homepage: http://shader.kaist.edu/mtcp/
Source code: https://github.com/eunyoung14/mtcp/
Related publication: Refer to our mTCP paper at NSDI 2014

5. Kargus Oct 2012

Kargus is a highly-scalable software-based network intrusion detection system (NIDS) that runs on commodity PCs and its performance is comparable to hardware-based NIDSes. It effectively exploits the potentials of modern hardware innovations such as multi-core CPUs, heterogeneous GPUs and multi-queue interface of NICs that drives its monitoring rate by up to 33 Gbps in real time. Kargus was mentioned in the **"10 Achievements of 2012 that put KAIST on the Spotlight."**
Role: Lead author
Project homepage: http://shader.kaist.edu/kargus/
Related publication: Refer to our Kargus paper at CCS 2012

6. HumanSign Sept 2010

An input device framework in which keystroke events are securely coupled with text-based content that is typed by humans with the end goal of reliable network payload delivery. This scheme is based on trusted computing principles that places the root of trust on a customized input device running a trusted platform module (TPM) chip and a small attester daemon within it. Each input event generates a cryptographic hash that attests to human activity and the combined message attestation (derived from such events) gets a third-party verifiable

digital signature. These human attestations are then attached to the actual messages which ultimately assist in reducing false positive rates in the recipients' filter modules.
Role: Lead author
Related publication: Refer to our HumanSign paper at APSYS 2010
